

## dplyr Cheatsheet by 슬기로운 통계생활

**across** - 함수를 여러 "칼럼"에 적용

```
mtcars[,1:6] %>%  
  summarise(across(where(is.numeric), mean, na.rm=TRUE))
```

```
>>  
      mpg    cyl    disp    hp  drat    wt  
>> 1 20.09062 6.1875 230.7219 146.6875 3.596563 3.21725
```

**slice family** 최대, 최소 구할때 개꿀

```
slice_min, slice_max, slice_sample
```

```
mtcars[,1:6] %>%  
  slice_min(mpg, n=2)
```

```
>>  
      mpg cyl disp  hp drat   wt  
>> Cadillac Fleetwood 10.4   8  472 205 2.93 5.250  
>> Lincoln Continental 10.4   8  460 215 3.00 5.424
```
